Reparameterizing Mirror Descent As Gradient

Descent2 Continuous-time Mirror Descent For A Strictly

Convex, Continuously-differentiable Function  $F : \mathbb{C} \rightarrow \mathbb{R}$

With Convex Domain  $C \subseteq \mathbb{R}^d$ , The Bregman Divergence

Between  $w$  and  $w + \eta \nabla F(w)$  is defined as  $D F(w) := F(w + \eta \nabla F(w)) - F(w)$ , where  $F := R \circ f$  denotes the gradient of  $F$ , sometimes called the link function. Trading off the margin, 2024 Learning To Learn By Gradient Descent By Gradient Descent  $\rightarrow F(\cdot)$ . While any method capable of minimizing this objective function can be applied, the standard approach for differentiable functions is some form of gradient descent, resulting in a sequence of updates  $T+1 = T \leftarrow \text{Trf}(T)$ . The performance of vanilla gradient descent, however, is hampered by the fact that it only makes use of the first-order information. Gradient Descent and Stochastic Gradient Descent: One practically difficult is that computing the gradient itself can be costly, particularly when  $n$  is large. An alternative algorithm is stochastic gradient descent (SGD). This algorithm is as follows:

1. Sample a point  $i$  at random
2. Update the parameter:  $w_{T+1} = w_T - \eta \nabla f(x_i; y_i; w_T)$  and return to step 1.
